

# Texas Medical Center Transportation Study

## Project Description

The TMC Transportation Study strategizes alternative mobility solutions and system improvements in an area of substantial traffic growth. The study consists of collecting and assessing data from major intersections, parking facilities, transit lines, and current/proposed developments for the purpose of addressing long-term mobility needs. The area in and around TMC includes numerous interests whose involvement in the study process is critical. These interests will be addressed in a series of Steering Committee meetings and Stakeholder meetings, as well as two Public meetings. While overall improvements will be considered for a general area surrounding TMC, the majority of analysis will focus on TMC and its immediate surroundings. As sub-consultant to Parsons-Brinkerhoff, Knudson coordinated the logistics for steering committee and public meetings, conducted individual interviews with member institutions within TMC, and reviewed and addressed public comments received at public meetings.

### Client:

City of Houston and Texas Medical Center

**Completed 2014**

### Services:

Intergovernmental Engagement / Transportation Planning

### Principal In Charge:

Patti Joiner

### Project Manager:

Angela Martinez
